Spectre’s “ANCHOR” (Model 8100) submersible series of industrial pressure transducers is specifically designed to operate in applications that are problematic for traditional submersible level transmitters. The conditions encountered in many process sumps, sewage wet-wells and dirty applications may cause plugging and erroneous readings with standard designs. The ANCHOR has an oversized diaphragm and flow-through standoff which helps to prevent clogging and build-up which may cause inaccuracies. In addition, each transducer’s output is digitally mapped to correct for any non-linearity or inaccuracies in the sensing element. This digital correction provides the most accurate and flexible submersible transducer in the industry.
